ELECTRO-HYDRAULIC ACTUATION FOR AUTO-CONTROL AND STABILISATION

Shown above is an example of a self-contained electro-hydraulic autopilot/auto-stabiliser actuator. The principles and mechanisms embodied in its design are also employed by Hobsons in powered flying controls incorporating high performance integrated electro-hydraulic servo actuation.

In the design of HOBSON ELECTRO-HYDRAULIC ACTUATORS reliability has been given precedence over features providing a very large power gain.

In a servo loop comprising amplifier, actuator and feed back device, the required overall loop gain can, in theory, be distributed at will between amplifier and actuator.

At one time, limited amplifier performance led to the design of delicate electro-hydraulic valves capable of responding to minute amplifier outputs. The performance available from the present transistor amplifiers permits the use of a more robust mechanism, avoiding small operating forces and metering orifices and yet meeting all modern aircraft and missile response requirements including those at small amplitudes.

No special filtration requirements are imposed by Hobson servo valves although, as in other hydraulic mechanisms, a good standard of cleanliness prolongs life.

HOBSON ELECTRO-HYDRAULIC ACTUATORS are in widespread use and have the highest possible reputation for reliability.

Hobson
