HIGH-TEMPERATURE CAPILLARY FURNACE AT NSLS BEAMLINE x14a

C.J. Rawn (rawncj@ornl.gov), J.Bai, M.J. Kramer, and C.R. Hubbard, Oak Ridge National Laboratory, Oak Ridge, TN 37831-6064

High temperature X-ray diffraction (HTXRD) is increasingly important in understanding materials forming and materials behavior at elevated temperatures. The Diffraction User Center at Oak Ridge National Laboratory supports several laboratory HTXRD instruments, neutron diffraction furnaces, and the X14A beam line at the National Synchrotron Light Source (NSLS). These facilities are available to users from industry and academia that propose in situ, HTXRD experiments related to improving materials to better transform or to save energy. These experiments include the measurement of thermal expansion coefficients, reaction kinetics, chemical stability, and phase transformations under a variety of atmospheres. For further information about the Diffraction User Center and user proposals see www.html.ornl.gov.

The capillary furnace recently made available at X14A is based on the Ames Laboratory design {L. Margulies, M.J. Kramer, R.W. McCallum, S. Kycia; *Rev. Sci. Instrum.* 70, 3554-61 (1999)}. Features of this furnace system are

- Temperatures from RT to 1500 °C
- Rotation of the sample to increase the particle statistics
- Gas flow control system (e.g. O₂, He, N₂CO₂, Ar, or specialty gas mixtures)
- Programmable temperature controller
- Data collection with Debye-Scherrer geometry

Currently X14A is configured for high-resolution data collection via use of an analyzer crystal in the diffracted

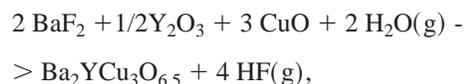

beam (FWHM $\sim 0.015^\circ 2\theta$) and a scintillation detector. Medium resolution data collection is also possible. To provide much faster data collection a curved PSD detector system developed by NSLS is being tested.

PHASE EVOLUTION OF Ba₂YCu₃O_{6+x} IN THE Ba-Y-Cu-F-O-OH SYSTEM

Winnie Wong-Ng (winnie.wong-ng@nist.gov), I. Levin, M. D. Vaudin, L. P. Cook, J. P. Cline, Ceramics Division, NIST, Gaithersburg; and R. Feenstra, Condensed Matter Sciences Division, Oak Ridge National Laboratory, Oak Ridge, TN

Currently, one of the most promising methods to produce long length Ba₂YCu₃O_{6+x} (Y-213) coated-conductor is the “*ex situ* BaF₂ process”. This process involves the use of e-beam co-evaporated BaF₂-Y-Cu-precursor films on rolling-assisted biaxially textured metal substrates (RABiTS), followed by post-annealing in the presence of water vapor. Although the overall reaction has been determined to be

the phase evolution and phase equilibria of the Y-213 phase in the multi-component Ba-Y-Cu-F-OH system are not completely understood. High-temperature x-ray experiments can provide critical information on phase evolution of Y-213 during the BaF₂ post annealing process, and have been conducted on amorphous precursor BaF₂-Y-Cu films prepared using the e-beam evaporation technique. A theta-theta geometry x-ray diffractometer equipped with a custom-designed vacuum and gas flow system was used for this study. With the recently installed position-sensitive-detector and the LABView software system for data collection, phase formation study of Y-213 and BaF₂ from amorphous precursor films in the presence of water vapor was conducted. This paper will discuss our recent results using the amorphous films of the BaF₂-Y-Cu-O system and subsystems prepared at Oak Ridge National Laboratory.
