"We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions."—*British Medical Journal*, May 3, 1890.

LISTERINE

*A safe, non-poisonous, unirritating
antiseptic solution*

LISTERINE is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle, or douche, in catarrhal conditions of the nose and throat.

LISTERINE in proper dilution may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

LISTERINE embodies a two-fold antiseptic effect, in that after the evaporation of its volatile constituents—thyme, eucalyptus, mentha, gaultheria, and ethyl alcohol—a film of boracic and benzoic acids remains upon the surface to which Listerine has been applied, affording more prolonged antiseptic protection.

LISTERINE is a trustworthy surgical dressing; it has no injurious effect upon the tissues in which the healing process is going on.

LISTERINE in teaspoonful doses will often afford relief in fermentative dyspepsia, and is largely prescribed, with excellent results, in the various forms of diarrhœa occurring in infants and adults.

LISTERINE literature, including special pamphlets upon *Respiratory Diseases*, may be had, by physicians, upon application to

'POLLACCINE' TREATMENT OF HAY FEVER

(Pollen Vaccine).

The method of treating Hay Fever by inoculation with 'Pollaccine' (pollen vaccine), introduced by Noon and elaborated by Freeman,¹ has been employed with excellent results by very many practitioners, some of whom have recorded their cases in medical journals.²

'POLLACCINE' is prepared in the Department for Therapeutic Inoculation, St. Mary's Hospital, London, W., and is supplied to the profession through the agency of Parke, Davis & Co.

As individuals differ widely in their susceptibility to pollen toxin, the dose of 'Pollaccine' appropriate to a given case should be ascertained by the ophthalmic-reaction, the requisites for which are supplied in a convenient HAY FEVER REACTION OUTFIT.

¹ Vide 'Lancet,' 1911, I, 1572; II, 814; also 1914, I, 1178.

² Vide 'Lancet,' 1912, II, 1716; 'Practitioner,' February, 1914; 'Liverpool Med.-Chir. Journ.,' July, 1914, p. 260.

A leaflet describing the mode of conducting the ophthalmic test, and of determining the required dose of 'Pollaccine,' will be forwarded on request by

THIS year's volume aims, like its predecessors, to be a faithful reflex of current Medical and Surgical thought. It is, therefore, of necessity coloured by the consideration of the many new problems which are thrust upon us by the War. These problems will confront the general Practitioner on every hand, and he must be prepared to deal with them.

Hence the current volume has a unique value, in that it furnishes the reader with a careful review of the latest achievements in War Surgery and Medicine, which will be of value now and in the years to come, and which cannot be obtained from any other source.

The civil side of the Practitioner's work has, of course, not been neglected.

The new "Annual" continues to be, as in the past, a digest of the best modern teaching, culled by experts from the medical literature of the world.
