Readership

Clinicians, dietitians, nutrition nurses and healthcare workers dealing with nutritional support; students and researchers; healthcare stakeholders and decision-makers

Description

Disease-related Malnutrition draws together - for the first time - all the published intervention studies comparing supplements or tube-feeding with standard care (no nutritional support) in both hospitals and the community, and groups them by disease area.

This book provides a complete evidence base for the use of either oral nutritional supplements or tube-feeding in patient care and goes on to make practical recommendations for the use of these forms of nutritional support.

The book also addresses future needs and considers areas where further work is still required, and discusses the performance of optimal clinical intervention studies.
