¹*Centre Hospitalier Guillaume Regnier*, ²*Université de Rennes II*, ³*Service Psychiatrique Accueil Orientation, Rennes, France*

This communication presents an epidemiological, clinical and therapeutic study about 100 cases of suicidal patients in crisis who have received psychiatric emergency care. Results of this research emphasize the relationship between patient's borderline personality disorder and sensorial/painful bodily experiences (like body marks, self-mutilations and scarifications). A specific emergency treatment in Guillaume Régnier hospital (Rennes - France) supports patients for reducing risk of suicidal behaviour.
