# ANTI-DIPHTHERITIC SERUM.

(B. W. & Co.).

THIS valuable therapeutic agent has proved eminently successful in the treatment of Diphtheria. None of the disagreeable sequelæ attributed to the new treatment have followed the use of Serum issued by us, or by reliable institutions. The great danger that menaces the advance of this most valuable method of medication lies in the fact that many unreliable and worthless Serums have been placed on the market, with the result that in many cases physicians have been disappointed. Prescribers should, therefore, be careful as to the source of their supply. With the aid of a distinguished London bacteriologist, who is thoroughly conversant with everything relating to the discovery, we were the first firm in England to prepare the liquid Serum, and the first in the world to produce a dried Serum of full potency. Having spent large sums of money in experiments and in the fitting of a properly equipped bacteriological laboratory, we request physicians who have tried the Anti-Diphtheritic or unsatisfactory results to state the medical journals, the source of their supply, so that the may be clearly distinguished from those less successful.

The discovery in our laboratory, we request physicians who have tried the Anti-Diphtheritic or unsatisfactory results to state the medical journals, the source of their supply, so that the may be clearly distinguished from those less successful. laboratories, of the method full potency has conferred a patients alike. One of the chief of the Serum treatment of has always been the large size considered necessary, and the of the syringe required for the have consented to the use of their minds when they see the which it is proposed to inject. This real difficulty is entirely overcome by the use of the dried Serum. It is readily soluble in three times its weight of water, and then forms a Serum of full potency. It keeps perfectly, and may be used with a comparatively small syringe, and seems to be less liable to cause a rash than the ordinary liquid Serum. Owing to the fact that the dried Serum will keep indefinitely, general practitioners find it possible to keep by them sufficient not only to provide against emergencies, but also to meet any calls that may be made upon them. In making up the solution, add the dried Serum to the water, previously sterilized, rather than the water to the Serum, and shake up for a few seconds until completely dissolved.

laboratories, of the method full potency has conferred a patients alike. One of the chief of the Serum treatment of has always been the large size considered necessary, and the of the syringe required for the have consented to the use of their minds when they see the which it is proposed to inject.

A Special Syringe for the injection of the Serum is supplied. Price 20s.  
This can be easily taken to pieces and sterilized.

Supplied to the Medical Profession, in either the liquid or lamellar form, at a uniform price of One Shilling per Tube, or Phial containing one therapeutic dose of 600 units (Behring).
