

to the practitioner, both as regards diagnosis, prognosis, and treatment." If the fasciculus now before us—the first of a series—be an indication of the manner in which the authors will execute their task, the result will be the production of a work of great value and rare artistic merit.

In this contribution the authors deal with the subject of laryngeal neoplasms, with special consideration of their etiology, clinical aspects, locality, course and terminations.

As is most fitting, benign growths are first noticed and classified, the division of papillomata being alone dealt with in this issue. These are considered in careful detail, and an accurate and concise account is given of their naked-eye and microscopic appearances and structure.

The accompanying plates, however, are *the* feature of the work. In the part now under notice they are four in number (seven figures), of exquisite and faithful execution, and are accompanied in each instance by a key in which the points of importance are indicated without marring the beauty of the drawings by the insertion of reference figures or numbers.

The volume cannot fail to be of the highest value to the practitioner, and we cordially commend it, not only to the specialist, to whom it ought to be really indispensable, but also to every physician or surgeon who desires to approach the practice of his profession from a scientific stand-point.

## NEW PREPARATIONS.

---

### **PAPAIN AND COCAINE LOZENGES.** T. CHRISTY & CO., LONDON.

Papaine has been frequently prescribed latterly, both for diphtheritic conditions of the throat and in the treatment of dyspepsia. Messrs. Christy have produced an elegant lozenge by combining papaine with cocaine, and one which will undoubtedly be of great service in the treatment of ulcers of the pharynx, tonsils, and other parts, and of cracked and fissured tongue. We can highly commend this preparation as both effective and agreeable.

### **PAPER FIBRE LINT.** BURROUGHS, WELLCOME, & CO.

This new preparation is adapted to most purposes for which ordinary lint is applicable, and should prove a valuable accessory to the treatment of surgical and other wounds. We believe it to be a valuable dressing in cases where there is constant discharge. It is highly absorbent, and is very clean, and is in every way an efficient substitute for ordinary lint.
