"We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions."—*British Medical Journal*, May 3, 1890.

# LISTERINE

*A safe, non-poisonous, unirritating  
antiseptic solution*

**LISTERINE** is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle, or douche, in catarrhal conditions of the nose and throat.

**LISTERINE** in proper dilution may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

**LISTERINE** embodies a two-fold antiseptic effect, in that after the evaporation of its volatile constituents—thyme, eucalyptus, mentha, gaultheria, and ethyl alcohol—a film of boracic and benzoic acids remains upon the surface to which Listerine has been applied, affording more prolonged antiseptic protection.

**LISTERINE** is a trustworthy surgical dressing; it has no injurious effect upon the tissues in which the healing process is going on.

**LISTERINE** in teaspoonful doses will often afford relief in fermentative dyspepsia, and is largely prescribed, with excellent results, in the various forms of diarrhœa occurring in infants and adults.

**LISTERINE** literature, including special pamphlets upon *Respiratory Diseases*, may be had, by physicians, upon application to

## ANTI-CATARRH VACCINE (Prophylactic).

Prepared in the Vaccine Laboratory of St. Mary's Hospital, London (Director—Sir A. E. Wright, M.D., etc.), and supplied to the Medical Profession through the agency of PARKE, DAVIS & Co.

This vaccine is adapted for the preventive inoculation of individuals who suffer from recurring "colds," in cases in which a bacteriological investigation is not convenient, and in cases where there is some general diminution in resistance, indicated by the patient becoming infected by any one of the several microbes which may cause these catarrhs. It is not intended to replace an autogenous vaccine in the case of patients who are subject to the periodic lighting up of a chronic infection by some one microbe.

Each c.c. of the vaccine contains:—

Micrococcus catarrhalis ...	100 millions	Staphylococcus ... ..	500 millions
B. pneumoniæ (Friedländer)	100 millions	Bacillus septicus (diphtheroid)	50 millions
Pneumococcus ... ..	80 millions	Bacillus influenzae ... ..	300 millions
Parodontal Streptococcus 12 millions.			

Dose.—0.5 c.c. for the initial dose; 1 c.c. to be given fourteen days after the first dose, and subsequently at monthly intervals during the winter. This vaccine may produce a marked local reaction if injected into muscular tissue. It should be administered *subcutaneously*.

*The vaccine is supplied in bulbs of about 1 c.c. and in bottles of 25 c.c.*

Particulars of other vaccines (including a MIXED VACCINE FOR TREATMENT OF COLDS) issued by the St. Mary's Hospital Vaccine Laboratory will be sent to any Medical Man, on request, by the Sole Agents—
