

It would be impossible to wash away all of the fecal organisms that can cause Hospital Acquired Infections...

Clostridium difficile
(harbored in feces)

Escherichia coli
(harbored in feces)

Enterococcus
(harbored in feces)

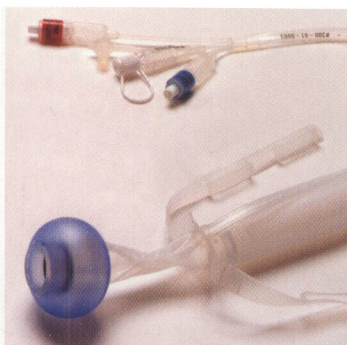

Klebsiella pneumoniae
(harbored in feces)

...but now it is possible to contain them with the new **Zassi** system.

Hospital Acquired Infections (nosocomial infections) threaten the financial health of every medical facility, and more importantly, the health of the patients under their care. Contamination from feces remains a significant exposure risk with no easy answer.

Until now.

The Zassi Bowel Management System protects patients and practitioners from fecal contact and contamination. The product is especially effective in the care of wounds and burns. Never before has a product been so specifically designed to reside in the anorectal anatomy for up to 29 days. Cleaning up is important, but effective containment represents a significant clinical advance.

Learn about the new solution for the problem of fecal contamination by visiting www.zassimedical.com or calling (904) 261-2169 today.
