DYNAMICS OF MECHANICAL FLIGHT

By SIR GEORGE GREENHILL, F.R.S.

Demy 8vo. 8 6 net.

Professor G. H. Bryan in the "Aeronautical Journal" says:—

"Up to the present time a noticeable feature of aeronautical work has been the want of a clear understanding as to the exact part which should be played by mathematical calculations in investigating the properties of aeroplanes and airships. . . . In view of the chaotic conditions that have thus arisen a very useful purpose will be served by the publication of a book under the authorship of so reliable a mathematical authority as Sir George Greenhill. What was most wanted, and what we here have is an exposition of the principles and formula, dynamics, hydrodynamics, and applied mathematics in general, that are applicable to the calculation of the forces acting on aeroplanes and airships. . . . The subjects treated include general principles of flight lift and drift, calculations of thrust and centre of pressure, the theory of discontinuous fluid motion, gyroscopic action, the screw propeller, and the pneumatical principles of an airship. The subject on gyrostatic action is very important owing to the great effect which this has on the steering of aeroplanes.

The present volume should prove invaluable to every student of aeronautics.
