

Notes for contributors

A submission to Applied Probability is considered as a submission to either *Journal of Applied Probability* (JAP) or *Advances in Applied Probability* (AAP). Longer papers are typically published in AAP, but the assignment of papers between the two journals is made by the Executive Editor on an issue-by-issue basis. Short communications and letters specifically relating to papers appearing in either JAP or AAP are published in JAP.

Papers submitted to the Applied Probability journals are considered on the understanding that they have not been published previously and are not under consideration by another publication. Accepted papers will not be published elsewhere without the written permission of the Trust. Submitted papers should be in English. It is the author's responsibility to ensure an acceptable standard of language, and a paper failing to meet this requirement may go back to the author for rewriting before being sent out for review.

Papers should include: (i) a **short abstract** of 4–10 lines giving a non-mathematical description of the subject matter and results; (ii) a list of **keywords** detailing the contents; and (iii) a list of **classifications**, using the 2010 Mathematics Subject Classification scheme (<http://www.ams.org/msc/>). Letters to the Editor need not include these. To assist authors in writing papers in the Applied Probability style, they may use the L^AT_EX class file `aptpub.cls`, available from <http://www.appliedprobability.org/>. Use of this class file is not a condition of submission, but will considerably increase the speed at which papers are processed.

Papers should be submitted electronically through ScholarOne at <https://mc.manuscriptcentral.com/apjournals>. All submissions will be acknowledged on receipt.

Copyright

The copyright of all published papers is vested in the Applied Probability Trust. When a paper is accepted for publication, the Trust asks the authors to assign copyright by signing a form in which the terms of copyright are listed. Failure to do this promptly may delay or prevent publication.

Authorisation to photocopy items for internal or personal use, or the internal or personal use of specific clients, is granted by the Applied Probability Trust for libraries and other users registered with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided that the corresponding processing and royalty fees (see <http://www.copyright.com>) are paid directly to CCC, 222 Rosewood Drive, Danvers, MA 01923, USA. 0021–9002/19

Original Articles

- 723 JOHN C. SAUNDERS. The number of K -tons in the coupon collector problem
- 737 ANYUE CHEN, YONG CHEN, WU-JUN GAO AND XIAOHAN WU. Sturm–Liouville theory and decay parameter for quadratic Markov branching processes
- 765 JANA REKER. Short-time behavior of solutions to Lévy-driven stochastic differential equations
- 781 TORSEL ERHARDSSON. Reciprocal properties of random fields on undirected graphs
- 797 YOUZHOU ZHOU. Transition density of an infinite-dimensional diffusion with the Jack parameter
- 812 SHUKAI CHEN AND ZENGHU LI. Strong feller and ergodic properties of the $(1+1)$ -affine process
- 835 KIYOSHI INOUE. Exactly solvable urn models under random replacement schemes and their applications
- 855 IAN W. MCKEAGUE AND YVIK SWAN. Stein’s method and approximating the multidimensional quantum harmonic oscillator
- 874 XIAOQING LIANG AND VIRGINIA R. YOUNG. Optimal proportional reinsurance to maximize an insurer’s exponential utility under unobservable drift
- 895 FRANK G BALL AND DAMIAN CLANCY. Asymptotic persistence time formulae for multitype birth–death processes
- 921 LOÏC HERVÉ AND JAMES LEDOUX. Robustness of iterated function systems of Lipschitz maps
- 945 YAAKOV MALINOVSKY AND YOSEF RINOTT. On tournaments and negative dependence
- 955 KENGO KAMATANI AND XIAOLIN SONG. Non-reversible guided Metropolis kernel
- 982 HE YI, NARAYANASWAMY BALAKRISHNAN AND XIANG LI. On ordered system signature and its dynamic version for coherent systems with applications
- 1003 STELLA KAPODISTRIA, MAYANK SAXENA, ONNO J. BOXMA AND OFFER KELLA. Workload analysis of a two-queue fluid polling model
- 1031 SYLVAIN RUBENTHALER. A central limit theorem for conservative fragmentation chains
- 1069 XIAOYU LEI. An efficient method for generating a discrete uniform distribution using a biased random source
- 1079 JEAN BERTOIN. A model for an epidemic with contact tracing and Cluster isolation, and a detection paradox
- 1096 NEDA ESMAEELI AND FARKHONDEH ALSADAT SAJADI. On the probability of rumour survival among sceptics
- 1112 L. C. G. ROGERS. The Bruss–Robertson–Steele inequality
