

status and mental health/illness, which will then serve as the basis for the second part which will be focused on psychiatric interventions. The development of Intercultural communication and the development of a strong therapeutic relationship are key for diagnosis and treatment. Errors in the diagnosis of migrant patients is all too common due to differences in symptom presentation and meaning, as well as due to psychiatrist's lack of familiarity with this population. In addition to migration, culture, and minority status, psychiatric treatment is also affected by biological and genetic differences, which are both subtle and complex. Cultural mediation is increasingly being introduced as means of bridging the linguistic and cultural gap between psychiatrist and migrant patient, however, for a variety of reasons, effective use of this resource demands that specific steps be taken and that professionals are sufficiently well trained.

The course will be in the format of lecture, case presentations and group discussion.

C07

Infant psychiatry, its relevance for adult psychiatry

M. Keren, S. Tyano. *Infant Mental Health Unit, Geha Mental Health Center, Tel Aviv University Sackler Medical School, Petach Tikva, Israel*

The aim of the course is to give adult psychiatrists some basic knowledge in infant psychiatry that has become in the recent years, very relevant to the understanding the link between brain development, early childhood experiences, pathophysiology of personality disorders in adulthood, and psychotherapeutic transference processes.

The course will be built as follows:

The first part will cover very recent data on the impact of early experiences in general, and attachment experiences in particular, on brain development and development of a theory of mind and empathy. Concepts of resilience, vulnerability, bio-psycho-social risk and protective factors will also be explored in length. Through these basic concepts, we will show how infant psychiatry is linked to prevention of adult psychopathology, and how the early attachment experiences reflect themselves in the psychotherapeutic process.

The second part will be clinical and will illustrate the basic concepts learned in the first part. A clinical case will be presented to show the development of borderline personality disorder from early childhood to adulthood, its transgenerational transmission to the offspring through disturbed attachment relationship, and some of the processes that took place during the dyadic mother-infant psychotherapy. We will show how parenthood can become a new motivation for change.

The course applies to any adult psychiatrist who is interested in the field of developmental psychopathology, and no previous experience with young children is needed. Clinical experience with personality disordered patients will be an advantage.

Delusions - diagnosis and treatment

M. Musalek. *Medical School, University of Vienna, Vienna, Austria*

Concluding the literature in definition, pathogenesis, nosological position and treatment of delusions we are confronted with a wide range of opinions. In the first part of the course the various definitional approaches and their value in clinical practice will be discussed. The main focus of second part of the course is dedicated to the manifold results concerning the pathogenesis of delusions, which showed that

delusions are caused by complex interactions of various mental, physical and social factors. The choice of a particular delusional theme is determined by gender, age, civil status, social isolation, and special experiences ("key experiences") whereas the incorrigible conviction is based on cognitive disorders and/or emotional derailments and reinforced by social factors. But delusions cannot be longer reduced to psychopathological manifestations once established and therefore persisting. The delusional conviction is a dynamic process which only persists if disorder maintaining factors become active. These disorder maintaining factors are not necessarily corresponding with the delusion's predisposing and triggering factors. In the third part classificatory problems will be raised. Assumptions concerning nosology and classification of delusions have ranged from an independent nosological entity to the attribution to a certain mental disorder, to multicategorical classification models. Previous polydiagnostic studies indicate that delusional disorders are neither a nosological entity nor due to one particular disorder (e.g. schizophrenia) but represent nosologically non-specific syndromes which may occur superimposed on all mental disorders. Most of the so-called primary delusions (or delusional disorders in a narrower sense - delusions not due to another mental disorder) have to be considered as diagnostic artefacts caused by the use of diagnostic criteria in particular classification systems. The final part of the course will focus on differentialdiagnostics and differentialtherapeutics. As delusions represent nosological non-specific syndromes with a multifactorial pathogenesis modern integrative treatment approaches (including psychopharmacological, psychotherapeutic and socio-therapeutic methods) have to be based on a multidimensional differential diagnosis of all the predisposing, triggering, and disorder maintaining factors. In this context the disorder maintaining factors provide the basis for effective, pathogenesis-oriented treatment of the actual symptomatology, whereas the predisposing and triggering factors provide informations for planning prophylactic long-term treatment.

Cognitive behavior therapy in anxiety disorders

L-G. Ost. *Department of Psychology, Stockholm University, Stockholm, Sweden*

During the last 25-30 years a large number of randomized controlled studies have been published on Cognitive behavior therapy (CBT) for various anxiety disorders. CBT is now an evidence based treatment for all the anxiety disorders, and the only form of psychotherapy that has achieved this status.

The purpose of this course is to give an overview of CBT for anxiety disorders and for each of the disorders the following components will be presented: 1) The CBT model of the primary maintaining factor(s) for the disorder, 2) The most important CBT treatment(s) for the disorder, 3) Illustrations from current randomized controlled studies, and 4) Short- and long-term results for each disorder.

By attending the course participants will get the most current update of CBT for anxiety disorders.

Taking care of ourselves: Managing stress, preventing burnout

W. Roessler, B. Schulze. *Department of General and Social Psychiatry, University of Zurich, Zurich, Switzerland*

Work in psychiatry can be highly rewarding, interesting, and challenging in a positive sense. On the other hand, we are confronted
