IAU Symposium

373

9–11 August 2022

Busan, Republic of Korea

Resolving the Rise and Fall of Star Formation in Galaxies

Star formation is relevant to nearly every area of astrophysics, from planetary science to galaxy evolution, yet the physical processes that determine the rates of star formation and its spatial and temporal distribution are still poorly understood. IAU Symposium 373 focuses on the impact that resolved studies of galaxies, both observational and theoretical, are having on the understanding of star formation on all scales. It highlights the latest advances in understanding star formation in its galactic context and how it drives galaxy evolution. A key advance has been the ability to spatially resolve the sub-kiloparsec scales on which star formation relations are established, bridging the gap between resolved studies in the local neighborhood and large-scale galaxy surveys. Alongside this, a new generation of cosmological simulations have helped to interpret these new data, providing new techniques for confronting them with observations. This volume shares these developments, for graduate students and researchers.

Proceedings of the International Astronomical Union

Editor in Chief: Prof. José Miguel Rodríguez Espinosa

This series contains the proceedings of major scientific meetings held by the International Astronomical Union. Each volume contains a series of articles on a topic of current interest in astronomy, giving a timely overview of research in the field. With contributions by leading scientists, these books are at a level suitable for research astronomers and graduate students.
