**Keywords:** structure hierarchy; sheet-silicate minerals; structural connectivity; stoichiometry; plane nets; oikodoméic operations; corrigendum

Table 5 of Hawthorne *et al.* (2019) lists five minerals: arapovite, ekanite, iraqite-(La), steacyite and turkestanite, as belonging to the ekanite group, with a sheet structure consisting of folded  $[4.8^2]$  sheets of tetrahedra of the form  $[\text{Si}_4\text{O}_{10}]$ . Ekanite (Szymański *et al.*, 1982) is a sheet structure consisting of folded  $[4.8^2]$  sheets of tetrahedra and is classified correctly. However, in the other minerals mentioned above, the silicate unit consists of a four-membered double-ring of the form  $[\text{Si}_8\text{O}_{20}]$  as correctly illustrated by Uvarova *et al.* (2004). Arapovite (Uvarova *et al.*, 2004), iraqite-(La) (Livingstone *et al.*, 1976), steacyite (Perrault and Szymański, 1982) and turkestanite (Kabalov *et al.*, 1998) are not sheet silicates and do not belong in this paper. We apologize for this miserable error.
