IAU Symposium No. 303

30 September – 4 October 2013

Santa Fe, NM, USA

The Galactic Center: Feeding and Feedback in a Normal Galactic Nucleus

IAU Symposium 303 highlights the latest Galactic Center research by scientists from around the world. Topics vary from theory through observations, from stars and stellar orbits through nearby black holes and explosive events, to the building blocks and transport of energy in galaxies similar to our own Milky Way. Highlights presented include: high-resolution, multi-wavelength large-scale surveys of molecular gas in the central molecular and dust zones of our Galaxy; studies of stellar populations and stellar orbits around the supermassive black hole Sgr A*; presentations of theoretical models to explain the dusty S-cluster object (DSO) G2, as well as the general accretion and jet formation in the vicinity of Sgr A*; and discussions of large-scale γ -ray emission in the context of energetic activity and magnetic fields in the Galactic Center. The volume concludes by looking ahead to future observing opportunities across the electromagnetic spectrum at very high resolution.

Proceedings of the International Astronomical Union

Editor in Chief: Prof. Thierry Montmerle

This series contains the proceedings of major scientific meetings held by the International Astronomical Union. Each volume contains a series of articles on a topic of current interest in astronomy, giving a timely overview of research in the field. With contributions by leading scientists, these books are at a level suitable for research astronomers and graduate students.
