Bristol
TYPE 173

The Bristol Type 173 Twin Rotor Helicopter relies on Layrub as the main driving elements between engines and rotors

Rubber trunnion blocks are used giving a cushioned drive there are no metal to metal contacts no lubrication therefore little maintenance

A Post card will see full technical data on its way to you.

THE SAUNDERS-ROE

Skeeter

. . . . THE IDEAL TRAINER

In these hard times economy is all-important — to the Services as much as to Industry That is one of the main reasons why the Skeeter makes such a strong appeal as a Trainer In economy it is in a class by itself, while in its characteristics as a Trainer it is — THE INSTRUCTOR'S DREAM

**All British in Design and
Construction**

**A Happy Combination of
Simplicity and Efficiency**

**Minimum Capital Cost
Minimum Operating Cost**

OBJECTS OF THE ASSOCIATION

The objects of the Association are to collect and disseminate information of a technical and semi technical nature pertaining to Helicopters and all other types of Rotating Wing Aircraft. The Association aims to work in close co operation with existing Aeronautical Bodies on matters affecting its objects and it may act as an Advisory Body in the promotion of legislation calculated to be of benefit to the development of Rotating Wing Aircraft.

“BRISTOL” TYPE 173 TWIN-ENGINEED HELICOPTER

This 10/13 passenger aircraft is scheduled to go into experimental service with British European Airways. A logical approach to the design problems of the safe, reliable, and commercially acceptable helicopter, the Type 173 may be expected to win a place for itself in inter-city airline service
