Unbearable Legacies: The Politics of Environmental Degradation in North Korea

Peter Hayes

Nearly 15 years ago, I wrote *Enduring Legacies: Economic Dimensions of Restoring North Korea's Environment*. This essay not only described a set of urgent environmental problems in North Korea, but also described its institutional and legal framework for environmental management. At the time, I had no idea that so many years would pass with no improvement in North Korea's situation. It has actually become far worse than I could then imagine. In 1994, I led a UN mission charged with helping North Korea to compile its first greenhouse gas emissions inventory for its national report under the UN Framework Convention on Climate Change, which North Korea had signed. Part of the justification for providing Global Environment Facility (GEF) funding for greenhouse gas reduction projects in North Korea was the creation of other benefits such as biodiversity. For this reason, I was looking into reforestation in North Korea as a way to capture carbon from the air as a way to preserve and restore biodiversity. I was talking over dinner with the head of North Korea's biodiversity program about such a project. He offered to pour me a shot of liquor from a bottle containing a snake. I demurred but he insisted, saying the snake liquor for public sale was low grade whereas this one — a snake with a diamond head not a square one — was the real thing, made from a rare and endangered species!

The following year, I sent another GEF mission to North Korea to inspect forests. North Korea provided extraordinary field access to the proposed fast-growth forests (in the sensitive northeastern mountains), provided scads of data and answered many penetrating questions by one of the world's leading development foresters. The project worked its way through the GEF system, receiving positive reviews, only to be withdrawn from final consideration by GEF's Governing Council. The reason? It was the year that conservative US Senator Jesse Helms had taken the US budget hostage, and the US Treasury Department wanted no red flags at GEF that might draw that bull to charge. A quiet word by the US representative on the Governing Council was enough to pull the plug, and the project was quietly killed, even though North Korea had met or exceeded all requirements.

Forests on Mt Baekdo. Photo Megyung Chung

In the years since then, North Korea has experienced extraordinary floods, famines and

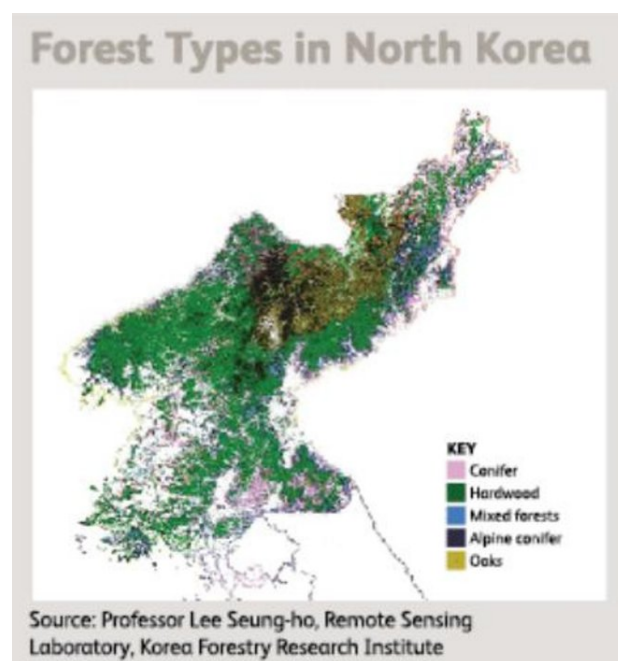

bushfires (many caused by drooping aluminum power lines setting fire to trees). North Korea is also afflicted by being downwind and close to China, thereby experiencing high levels of acid rain; and by climate change that may aggravate already extreme weather on the peninsula. But the bulk of the environmental losses and vulnerability experienced by North Koreans derives from the disastrous state of its economy and the mass poverty of the population, the shriveled status of its administrative and institutional capacities, the high levels of tension created by the nuclear issue and the continuing division of the Korean Peninsula. One of the most acute environmental problems in North Korea is deforestation. This problem has a long history, stretching back to over-cutting by Japanese colonialists, the impact of the Korean War and poor reforestation practices by North Korean agencies. The reforestation effort relied on mobilized adult and youth mass labor units working with simple tools. Specialized nurseries and well-trained foresters grew seedlings, but without good fertilizer and seed stock, the success rate was small, especially on steep, north-facing slopes.

farmers to cultivate steep slopes, to convert forested areas into agriculture, and in some cases, to actually re-engineer landscapes. When unprecedented floods hit North Korea, much of the topsoil in these areas was washed downstream (also thereby silting up many of the run-of-the-river hydro-electric dams in North Korea). Is it possible to estimate the scale of the reduction in North Korea's forest resources? In 1990 North Korea reported that it had about 9 million hectares of forest out of about 12 million hectares in national territory. In 1994, the GEF forester who I sent to North Korea estimated that the nominal North Korean forest in 1993 actually was about 9 million hectares, but that only 7.8 million hectares were "in practice" forested. Overall, North Korea itself says that its forests are about 42 percent coniferous, 35 percent deciduous/hardwood species, and 23 percent mixed conifer and deciduous forests. Pine species dominate the coniferous forests, and oaks dominate the deciduous species. However, the conversion and usage described below may have shifted these ratios far from the official figures.

These basic problems were made worse by land-use decisions in the early and mid-1990s when food shortages led authorities to direct

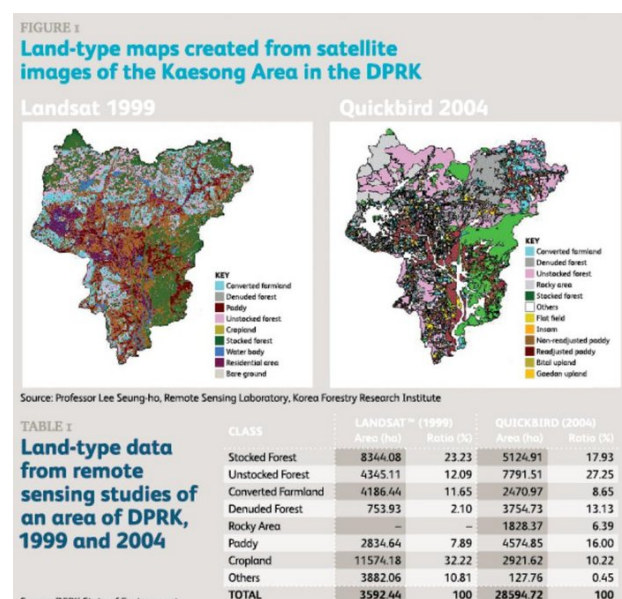

Luckily, these days we don't have to rely on

official North Korean data to estimate the country's forest cover. Both international and South Korean remote sensing techniques using satellite imaging have been used to evaluate the status of North Korea's forests. Using these sources, Professor Lee Seung-ho from the Korea Forestry Research Institute in Seoul has estimated North Korea's total forest cover as follows: 9.77 million hectares (Mha) in 1970 (North Korean source), 8.97 Mha in 1987 (FAO source), 8.45 Mha in 1994 (KFRI Satellite Image Analysis), 7.53 Mha in 1999 (KFRI Satellite Image Analysis).

An additional time-series of North Korea's forest area from the UN FAO 2005 Global Forest Resource Assessment shows a trend from 8.20 to 6.82 to 6.19 Mha in 1990, 2000, and 2005, respectively.

A very local snapshot of this trend from 1999 (using Landsat) and 2004 (using Quickbird) in the Kaesong area is shown on the previous page and reveals the rapid conversion of forested areas into agricultural and other uses shown in Table 1 — a pattern replicated in many parts of North Korea.

environmental functions. These include maintenance of watersheds by capturing, slowing and cleansing rainwater for downstream use, including human drinking water, irrigation, and industry; provision of habitat for most of the wild animals and plants that survive in North Korea; supply of key ingredients of traditional medicines, all the more essential at a time when many man-made pharmaceuticals are unavailable in North Korean clinics and hospitals; and as a source of substantial supplementary food scavenged by adjacent rural populations who have access to forests (unlike rice growing areas in the southern and coastal areas).

Second, rural populations use forests for wood fuels that substitute for coal and agricultural wastes formerly used for heating, cooking, and fertilizer, but that are now diverted to survival energy needs. Finally, forested mountains are culturally important to Koreans, embodying the spirit of the Korean soul. Not only has the total forested area fallen by roughly one-third over 15 years leaving denuded and poor quality agricultural land in its stead, but much of the remaining forest is also degraded by these multiple uses. I will now briefly visit each of these aspects in greater depth.

Why does the area and status of North Korea's forests matter? First, forests have essential

Deforested area of North Korea along the Tumen river across the Chinese border

North Korea has rich biodiversity including many species that are endangered. It also supplies habitat to a number of migrating species, especially birds such as the cranes that fly from Japan via Korea to Siberia and beyond. As a signatory of the Biodiversity Treaty, North Korea declared in its 2003 State of the Environment report¹ that for higher vegetation, it has 10 critically endangered species, 42 endangered species, 76 rare species and 26 species of region-based populations, giving a total of 158 species, representing 4 percent of threatened higher vegetation species worldwide. In the case of vertebrates, 9 critically endangered species, 29 endangered species and 119 rare species account for around 11 percent of global vertebrate species under threat. The degradation of ecosystems and forests due to land-use conversion combined with unregulated extraction of forest resources are the primary cause of the threat to so many species. How much of the conversion today is due to local demand, and how much to the cutting and exporting of timber to China, is an important but unknown factor.

The second dimension of economic sustainability that links human survival to forests in North Korea is the use of fuel wood. Various analysts have looked closely at the use of biomass in North Korea. Nautilus analysts have reviewed all these sources in detail and find that the total available woody biomass in North Korea decreased from over 13 million tonnes in 1990 to just under 11 million tonnes in 2005, but of those totals, about 4 to 4.5 million tonnes were biomass from forest areas cleared for one purpose or another. (See Figure 2)²

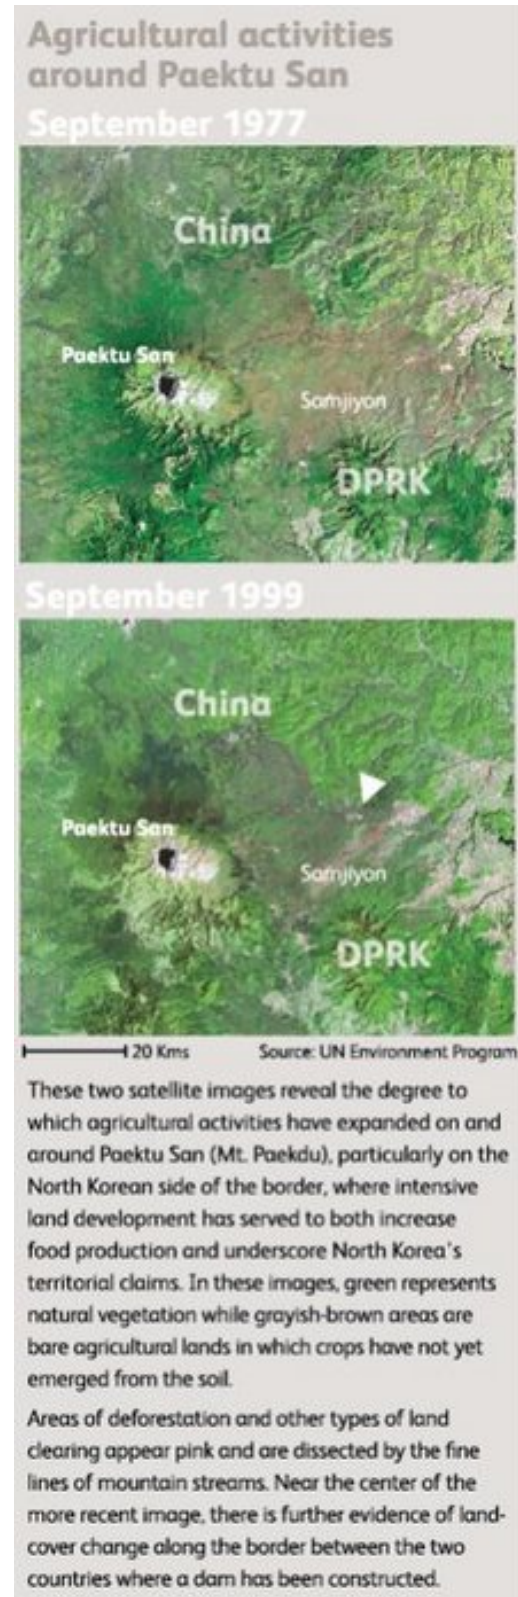

DPRK truck powered by a coal (and/or biomass) gasifier. Source: Nautilus Institute

Separately, we have reviewed estimates in North Korea of wood fuels usage. Official North Korean estimates set wood for charcoal production at 0.8 to 1 million m³, wood for construction at 3-5 million m³, and approximately 500,000-650,000 m³ for industrial fuel wood and for paper production. Based on our assessment of North Korea's forest resource base (see Figure 2), we use lower estimates for 1990 in some of these categories — 650,000 m³ wood for charcoal production, and 1 million m³ wood for construction — but use 650,000 m³ for industrial fuel wood and for paper production. Overall, we estimate that today, fuel wood (as wood and converted to charcoal) accounts for about a quarter of North Korea's primary energy supply — about the same as South Korea in 1965. This data suggest that by 2005 some 35 percent, at least, of North Korean

biomass use was unsustainable—that is, cut from forest stocks, not from annual forest growth. Our estimate for total wood use for all purposes in North Korea in 2005 is 5.6 million tonnes. Thus, it appears that North Korea's population is already using the bulk of the nation's available supply of wood as fuel and for other uses. North Korea's government has undertaken massive reforestation projects with mixed results, but clearly reforestation and related forest and soil conservation activities constitute an area where international assistance and capacity building would be useful. Reforestation for carbon capture is an area that developed countries could finance in North Korea using the Clean Development Mechanism, thereby introducing a climate change driven solution to North Korea's deforestation problem. Mountains and forests also hold a special place in Korean culture and spiritual life. Thus, it is significant that even in and around the world heritage site of Mt. Paekdu — a symbol of Korean nationalism and the legendary birthplace of Kim Jong-il — rapid and significant degradation is observable.

Conclusion

There are many other critical environmental issues in North Korea. The country, it turns out, is still producing globally significant amounts of persistent organic pollutants such as DDT (about 230 tonnes per year) and similar pesticides that accumulate in food chains and ecosystems thousands of miles downwind.³ Disposal of toxic wastes, work-place occupational health and safety, acid rain, greenhouse gas emissions and many other environmental issues must be solved in North Korea.

The results of these efforts will be a long-term legacy that will be inherited by a future generation of Koreans. They will have to preserve what's left of wild North Korea; conserve what's in use; and restore what has been abused. The continued isolation of North Korea has led to a rapid degradation of the ecological assets that existed at the end of the Cold War, and it is certain that the fastest way to destroy what's left of North Korea's ecology would be war.

Many of these ecological issues are technical and apolitical, and even at the height of international tensions due to the nuclear issue, North Korea's leadership has kept them separate and accepted external engagement and assistance. Should a way forward emerge at the geopolitical level to resolve the nuclear issue on the Korean Peninsula, many environmental issues will become channels for cooperative engagement between North Korea and external agencies.

Perhaps the ultimate ecological agenda will be realization of a vision for the future of the Demilitarized Zone, with a coalition of South Korean and international agencies arguing that a "peace park" should culminate in a set of biodiversity corridors that stretch from North Korea's borders with China and Russia to the north, to the tip of Jeju Island in the South.⁴ So far, North Korea has given no sign of interest in this concept, trespassing as it does on the

Korean People's Army turf. But more than 100 peace parks exist in conflict zones around the world, and if tensions fall, perhaps even the KPA will support a constructive agenda for managing this still-wild area that crosses the peninsula. Meanwhile, many small and urgent steps can be taken to reduce the rate and scale of environmental damage in North Korea due now as much to grinding poverty as to institutional failures in the past.

The DMZ peace park could start with a joint US-North Korean-Russian project on avian flu sampling in the Tuman River wetlands. Other options include sustainable livelihood projects that restore habitat for migratory birds — at least one of which is already underway; eco-tourist projects wherever pristine habitats remain; sustainable agriculture; renewable energy; and climate mitigation and adaptation projects, especially at the community and city levels. There is no shortage of options, and an infinity of needs. And ways exist to work around the barriers that divide North Korea from the rest of the world. There's no time to wait, or these enduring legacies will become unbearable, and feed into a vortex of chaos and collapse in North Korea, with unimaginable consequences for humans and nature alike.

Postscript

Many had high hopes that things might change quickly in relation to Korea when Obama was elected. However, as the months passed, two things became clear. First, Obama's political appointees on Asia in general and Korea in particular were not high on the political agenda for rapid confirmation. This left the United States on auto-pilot, with many officials and pundits asking why change course from Chris Hill's strategy of endless Six Party Talks?

Second, the DPRK was not going to play along with this game. They escalated rapidly in rhetoric aimed directly at Obama as more "Bush in a new bottle," that is, fundamental hostility to their existence, and denial of their

status as a nuclear weapons state. They fired booster rockets and detonated a nuclear device which, unlike the first test in October 2006, actually worked.

Meanwhile, two very silly American journalists managed to get themselves arrested by the North Koreans. Unsurprisingly, they were held, tried and given long sentences. This put pressure on the Administration to find a way to release them in order to re-engage the DPRK in nuclear talks. After rejecting Gore as insufficiently “presidential” (his company employed the journalists), the DPRK accepted former President Bill Clinton and released the journalists to him after his visit and meeting with Kim Jong Il.

Politically, the DPRK had demonstrated that Obama could not stop them firing missiles or nuclear devices; and by releasing the journalists, they put the political onus on Washington to make some kind of reciprocal overture knowing full well that this was unlikely to be forthcoming—not least because the North Korean topics for discussion all imply that the DPRK was a nuclear weapons state, something that the United States still does not accept, at least officially.

They also released South Koreans, including a worker from the Kaesong zone and a fisherman who had entered North Korean waters, thereby putting pressure on the South Korean government to reciprocate in some way.

In my view, the DPRK does not anticipate any strategic shift on the part of the United States, and even less so, from the ROK. The former is distracted by other global and domestic problems far more important to Obama than North Korea. The latter is committed to “reciprocity” in inter-Korean relations, by which the current ROK government means capitulation on South Korean terms.

Rather, the DPRK is setting the scene to simply hold the United States away while it

consolidates its nuclear weapons, extracting the remainder of the plutonium from spent fuel needed to replace that blown up in its first two tests (which will be achieved by about November). On the political front, it is demonstrating to China that the United States and the ROK remain opposed to the existence of the DPRK as it is constituted today, and therefore, that the DPRK must increase and improve its nuclear deterrent.

Obama’s UN speech on September 20th, like his Global Abolition speech in Prague on April 4th, pointed fingers again at the DPRK. But he also stated directly for the first time (in relation to North Korea) that the United States was willing to engage in unconditional talks. Officials in the US government scrambled over the following days to prepare talking points under many different scenarios for how talks might commence and unfold.

Meanwhile, in late September, the DPRK is allowing a spate of private visits to Pyongyang that have been on hold for months. No doubt a series of probes about intention in Pyongyang and Washington will now commence and some desultory talks might even take place at the level of “senior envoys.”

After Chinese Premier Wen Jiabao met with Kim Jong Il in Pyongyang, KCNA declared on October 4, 2009 that Kim stated at their meeting that “hostile relations between the DPRK and the United States should be converted into peaceful ties through the bilateral talks without fail,” and expressed “our readiness to hold multilateral talks, depending on the outcome of the DPRK-U.S. talks”—referring here to the Chinese-hosted Six Party Talks. In short, Kim conceded nothing to China, asserting that the DPRK would return to multilateral talks once the fundamental US-DPRK hostility is overcome in direct talks. As China justified hosting the Six Party Talks as a venue at which such direct talks could take place but never moved the United States at the

Talks to address the core issues of concern to the DPRK, it can hardly criticize the DPRK for adhering to the view that only the direct antagonists can resolve the primary conflict between them--a position that it has argued itself on many prior occasions.

Indeed, on October 6, a Chinese Foreign Affairs spokesman stated that China "appreciates" the DPRK's view in this regard. Indeed, the DPRK's statement that it will return to the Six Party Talks only after direct bilateral talks have already resolved hostility into peace between the DPRK and the United States is actually a sly insult to China. Obviously, for the DPRK to commit to engaging in multilateral talks hosted by China only after the core issues have been negotiated already would simply highlight the latter's inability to force the United States to change its position compared with the DPRK and by the same token, demonstrate the DPRK's fierce independence from China. For these reasons, insiders in Washington immediately dismissed Wen's visit as reason to hope for a near-term breakthrough in discussions with the DPRK on terms acceptable to the United States.

None of this will address the core insecurity that faces the DPRK and the United States in Korea. That is, the continued existence of the DPRK is taken as a threat in its own right for the United States, embodying values and practices that are anathema to American political culture, and posing a direct conventional and now nuclear threat to US and allied forces in Korea. For the North Koreans, the continued projection of American nuclear threat against the DPRK, and unrealistic demands for North Korean nuclear disarmament without prior shifts in the nature of US-DPRK political and military relations leave them with nowhere to go to escape the dilemmas that they face.

Thus, I foresee that the United States will rely primarily on military and extended nuclear

deterrence as the leading elements of its coercive diplomatic strategy to contain North Korea's nuclear challenge to the regional and global status quo; and the DPRK will take ever more escalatory and provocative actions to try to shift the United States to engage it directly on the core issues of hostility and insecurity. In addition to uranium enrichment, which it has now declared it has experimented with successfully, the most obvious North Korean next moves are to strike up nuclear alliances around the world with other states.

A North Korea contained with nuclear threat as an exception that proves the non proliferation global rule appears to be more valuable to Obama's concept of global nuclear abolition than shifting to a non-nuclear military strategy combined with cooperative diplomacy and economic engagement to actually resolve the North Korean nuclear threat, and restore it to the NPT regime.

Dismally, therefore, I conclude that the United States will not lead in Korea, but will revert to bad habits and standard operating procedures from the Cold war that will sustain the conflict indefinitely, while the DPRK will continue to use nuclear threat to evoke an American response, and then lapse into a near comatose state until winter passes, and we begin a new cycle of positional warfare in 2010. September 24, 2009.
