Introduction: The 1978 Italian reform of psychiatric services initiated the closure of psychiatric hospitals encouraging the development of community mental health. However, there is wide variability across regions in the amount of resources devoted to community-based psychiatric care, and the range of services provided still is cause of concern.

Objectives: To evaluate the quality of mental health care delivered to patients with schizophrenia and related disorders taken-in-care by mental health services in four Italian regions (Lombardy, Emilia-Romagna, Lazio, Sicily).

Methods: Thirty-one clinical indicators concerning accessibility, appropriateness, continuity, and safety were defined and estimated using healthcare utilization (HCU) databases, containing data on mental health treatments, hospital admissions, outpatient interventions, lab tests and drug prescriptions.

Results: A total of 70,586 prevalent patients with schizophrenia treated in 2015 were identified, of whom 1,752 were newly taken-in-care. For most patients community care was accessible and moderately intensive. However, care pathways were not implemented based on a structured assessment and only half of the patients received psychosocial treatments. One patient out of ten had access to psychological interventions and psychoeducation.

Activities specifically addressed to families involved a third of prevalent patients and less than half of new patients. One patient out of six was admitted to a community residential facility, and one out of ten to a general hospital psychiatric ward (GHPW); higher values were identified in new cases. In general hospitals, one-fifth of the admissions were followed by readmission within 30 days of discharge. For two-thirds of patients continuity of community care was met, and six times out of ten a discharge from a GHPW was followed by an outpatient contact within two weeks. For cases newly taken-in-care the continuity of community care was uncommon, while the readiness of outpatient contacts after discharge was slightly more frequent. Most of the patients received antipsychotic medication, but their adherence to long-term treatment was low. Antipsychotic polytherapy was frequent and the control of metabolic side effects was poor. The variability between regions was high and consistent.

Conclusions: The Italian mental health system could be improved by increasing the accessibility to psychosocial interventions, improving the quality of care for newly taken-in-care patients, focusing on somatic health and mortality, and reducing regional variability. Clinical indicators demonstrate the strengths and weaknesses of the mental health system in these regions, and, as HCU databases, they could be useful tools in the routine assessment of mental healthcare quality at regional and national levels.

Role of central and peripheral neuropeptides in escitalopram-induced weight gain and metabolic changes

M. Y. Yilmaz

PSYCHIATRY CLINIC, VAN TRAINING AND RESEARCH HOSPITAL, VAN, Türkiye

doi: 10.1192/j.eurpsy.2023.1040

Introduction: Selective serotonin reuptake inhibitors (SSRI group antidepressant drugs) are not significantly different from tricyclic antidepressants and other antidepressants in terms of efficacy, but provide significant advantages in terms of side effects and toxicity. One of the most important side effects of antidepressant drugs is weight gain. However, there is not yet enough study on weight gain mechanism.

Nutrition and hunger-satiety circle are occurred under the control of neuropeptides and hormones that are synthesized and secreted from the hypothalamic arcuate nucleus (ARC), adipose tissue and the pancreas.

In this study, we examined how escitalopram affects the body weight, the body mass index, the serum lipid profile, the liver function tests, the underlying molecular mechanisms of weight change, the relationships these mechanisms and the hypothalamic nutrition regulatory neuropeptides such as POMC, NPY, leptin, CCK and insulin that is a pancreatic hormone.

Objectives: In order to understand the relationship between antidepressants and metabolic risk factors such as diabetes and obesity
