### Introduction

The development of catatonia in a 38 year old Nigerian man suffering from schizophrenia was analyzed in terms of its bio-psycho-social model of disease.

### Objectives

1. To highlight the presentation of catatonia specifier
2. To investigate the etiology of catatonia specifier

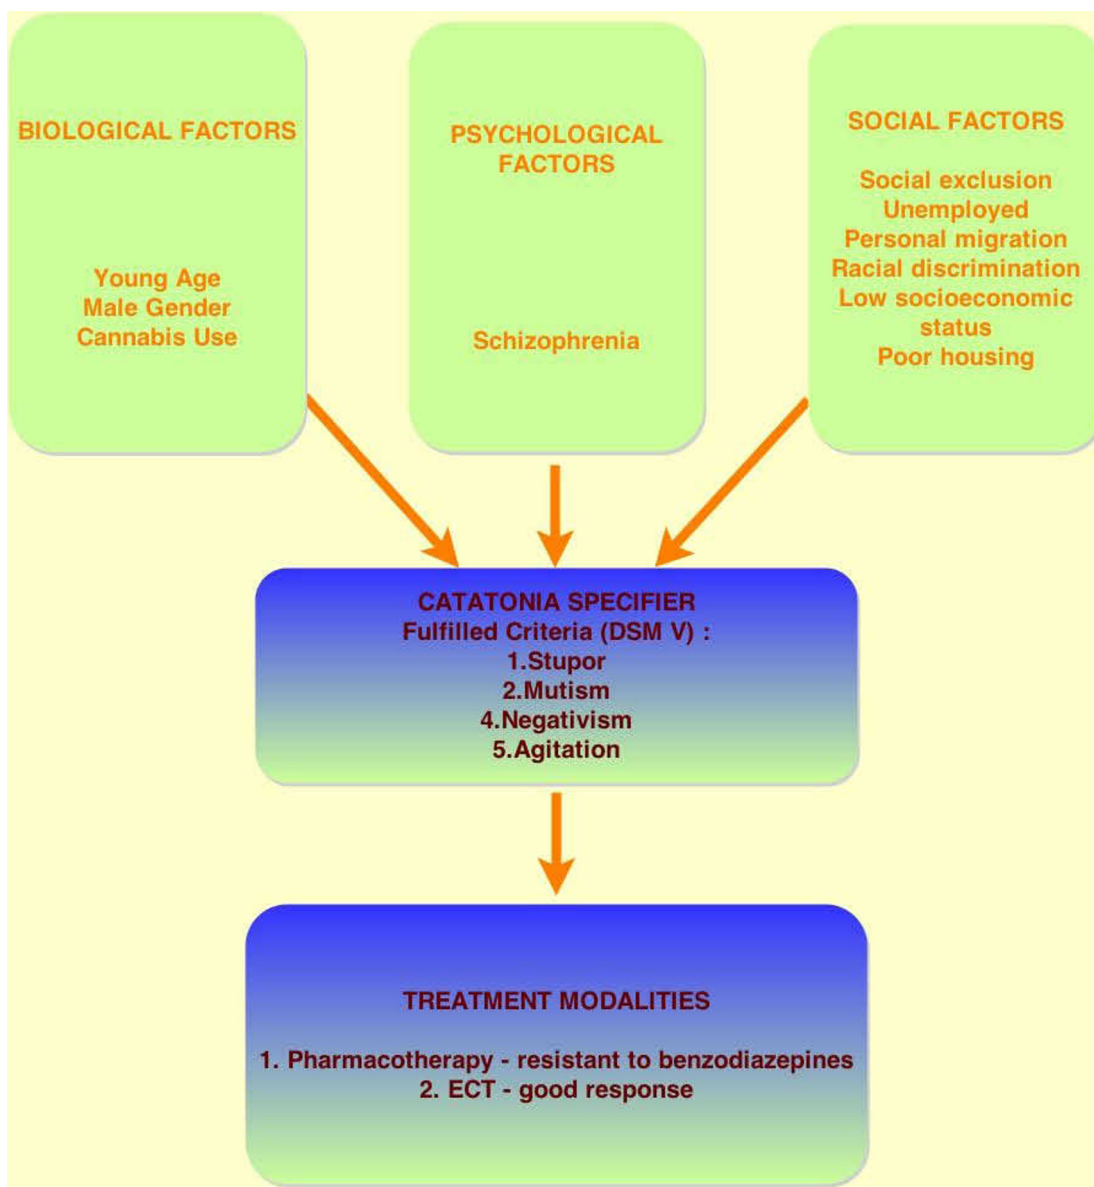

### Aims

1. To utilize the bio-psycho-social model of disease in order to investigate the etiology of catatonia specifier
2. To highlight the treatment modalities of catatonia specifier

### Methods

1. Interviewing the patient
2. Analysing all investigations and documentation made during multiple admissions to both psychiatric and medical hospitals.
3. Evaluating the response to various treatment modalities.
4. Carrying out literature reviews.

### Results

### Conclusions

Although the aetiology of catatonia specifier remain somewhat unclear even after many years of study, the bio-psycho-social model is nevertheless useful in understanding the development of this condition. The possible treatment modalities were also identified.
