**Objectives:** The objective of this study is to examine an association between apathy and caregiver burden in amnesic mild cognitive impairment.

**Methods:** This was a retrospective cross sectional study. We selected 92 consecutive patients diagnosed with Amnesic Mild Cognitive Impairment who had a comprehensive battery of neuropsychological tests and a behaviour rating scale of interest for this study recorded in the database. Correlation analysis was done to look into association between apathy and caregiver burden.

**Results:** Apathy score was significantly related to caregiver burden in amnesic mild cognitive impairment.

**Conclusions:** Our study has shown high association of apathy with caregiver burden in aMCI.
