

The Backwarming Effect and Carbon Stars

DIMITRI N. DOIKOV and EKATERINA M. DOIKOVA

Odessa State University, Odessa, Ukraine

The abundant molecules are an important component in the opacity source function. This importance increases for cooler carbon stars. All stellar spectra contain “transparent windows” with a pseudo-continuous flux. We have calculated the contributions from a mixture of molecules in these spectral regions and estimated the changes in effective temperatures due to the backwarming effect.
