

Causes, Reason and Grace¹

John Haldane

1. Paul's one cheer for natural theology

St Paul's letter to the Romans is a theologically dense and complex text. Probably written in Corinth during the first five years of Nero's imperial reign (54–9) it was intended to prepare the ground for Paul's planned journey to Rome. The church there was not of his creation and nor had he previously visited it, but he recognised its commitment and potential for the spreading the Christian message throughout the empire, writing that "your faith is talked of all over the world" (Romans 1.8).² Melancthon described the letter as a 'summary of all Christian doctrine'³ and although it is not a systematic treatise, *Summa Doctrinae Christianae*, it is comprehensive statement of Paul's understanding of the theology of redemption through the life, death and resurrection of Jesus Christ. Paul writes:

So then, now that we have been justified by faith, we are at peace with God through our Lord Jesus Christ; it is through him, by faith, that we have been admitted into God's favour in which we are living, and look forward exultantly to God's glory. Not only that; let us exult, too, in our hardships, understanding that hardship develops perseverance, and perseverance develops a tested character, something that gives us hope, and a hope which will not let us down, because the love of God has been poured into our hearts by the Holy Spirit which has been given to us (Romans 5.1–5).

His account of Christ's death and resurrection as providing salvation to an otherwise hopeless cause, namely sinful humanity, is challenging in at least two respects. First, Paul regarded his teaching

¹ The present article is based on the text of the Hulsean Sermon given before the University of Cambridge in the University Church of St Mary the Great, Sunday 24th February 2008.

² All biblical quotations are from the New Jerusalem Bible.

³ "Caput et summa universae doctrinae christianae", see 'Dispositio orationis in ep. Ad Romanos' in C. G. Bretschneider (ed) *Philippi Melancthonis opera quae supersunt omnia* (Halle: Schwetschke, 134–1960) vol. 15, p. 445.

of justification and redemption through Christ as quite distinct from the ideas of the philosophers of his own and previous centuries and even as a rebuke to their wisdom. The impotence of their intellectual search is revealed in the truth that not only could they not arrive at such a teaching, but it remained unintelligible to them. As he puts it in 1 Corinthians 1.21–23: “Since in the wisdom of God the world was unable to recognise God through wisdom, it was God’s own pleasure to save believers through the folly of the gospel . . . we are preaching a crucified Christ: to the Jews an obstacle they cannot get over, to the gentiles foolishness”.

Second, Paul directs Christians to set aside any thought that they may be saved by their own observance and good works. Only grace saves, (though through works we may co-operate with it) and grace is only available through Christ.

The first challenge must be felt acutely by a philosopher; but although Paul may have been troubled by his encounter with Epicurean and Stoic thinkers on the Athenian Areopagus (Acts 17) he was not altogether dismissive of the exercise of natural reason as a means of coming to know of the existence of God. For earlier in Romans he writes:

Ever since the creation of the world, the invisible existence of God and his everlasting power have been clearly seen by the mind’s understanding of created things. (Romans, 1: 20)

So notwithstanding his slighting to the philosophers, Paul also invokes the style of reasoning, familiar then and since, that argues from the character of the cosmos to its divine authorship. His words resemble a passage in Cicero’s *On the Nature of the Gods* (Book II) in which the author sets out the consensus among members of the philosophical schools about the evidences of intelligent authorship in nature. Cicero writes:

What can be so obvious and clear, as we gaze up at the sky and observe the heavenly bodies, as that there is some divine power of surpassing intelligence by which they are ordered.⁴

When writing to the Romans Paul may well have been remembering similar Stoic statements. Stoicism had long flourished in Tarsus and was the established philosophy in Rome at the time of Paul’s letter. In the description of his encounter with the philosophers of Athens he is reported as saying “‘since it is in him that we live, and move, and exist’, as indeed some of your own writers have said: ‘We are all his children’”. (Acts 17. 28). The first quoted phrase is from

⁴ See P. G. Walsh trans. Cicero, *The Nature of the Gods* (Oxford: Clarendon Press, 1997), Book 2, para 4, p. 48.

the *Cretica* of Epimenides⁵ and the second from the *Phaenomena* of Aratus⁶ who was certainly Stoic trained. This is not to suggest that Paul was influenced by Stoic doctrines, let alone that he was himself any kind of Stoic; indeed in the Acts case he is deploying the device of quoting sources only to reinterpret them. Yet it indicates a familiarity with philosophical natural theology and in the case of the Romans passage Paul endorses the idea, shared with Stoicism, that nature bears witness to its divine origin.

2. Natural theology in modern times

We, however, are less sure of such natural reasoning, and that fact is reflected in the intellectual insecurity of theists today. So far as the specific content of Christian theism is concerned there is also a marked lack of confidence about this; and increasingly Christians adopt an accommodationist attitude to the ways and beliefs of the world, retreating from reason into sentiment, and from faith into works. This is true both of ‘conservatives’ and of ‘liberals’: the former focussing on such issues as traditional marriage and the sanctity of life, the latter on social justice and the environment. Whatever the value of these concerns, however, Christian orthodoxy teaches that such merit as may attach to them is the work of grace, and the presentation and defence of that striking theological claim calls for intellectual nerve.

The practice of philosophically-informed apologetics is now not so prevalent as it once was, but equally the situation is better than in the middle of the twentieth century when theology had shrunk back from

⁵ It appears as the last line of the sole surviving quatrain of the poem:

They fashioned a tomb for thee, O holy and high one
The Cretans, always liars, evil beasts, idle bellies!
But thou art not dead: thou livest and abidest forever,
For in thee we live and move and have our being.

As further evidence of Paul’s familiarity with Greek ‘theological’ writings, he quotes the second line in Titus 1. 12: “It was one of themselves, one of their own prophets, who said, ‘Cretans were never anything but liars, dangerous animals, all greed and laziness’”. The first identification of Paul’s reference is made by Clement of Alexandria, *Stromata*, Book 1, ch. 14: ‘Epimenides the Cretan, whom Paul knew as a Greek prophet, whom he mentions in the Epistle to Titus, where he speaks thus: “One of themselves, a prophet of their own, said, The Cretans are always liars, evil beasts, slow bellies. And this witness is true.” You see how even to the prophets of the Greeks he attributes something of the truth, and is not ashamed, when discoursing for the edification of some and the shaming of others, to make use of Greek poems’.

⁶ “From Zeus let us begin; him do we mortals never leave unnamed; full of Zeus are all the streets and all the market-places of men; full is the sea and the havens thereof; always we all have need of Zeus. For we are also his offspring”, Aratus *Phaenomena*, lines 1–5, from *Callimachus, Hymns and Epigrams. Lycophron. Aratus*. Translated by Mair, A. W. & G. R., Loeb Classical Library Volume 129 (London: William Heinemann, 1921) lines 1–5.

the often withering attacks of logical positivists and sceptical empiricists. The eighteenth century, by contrast, was a time of ambitious Christian apologetics, judged necessary by the inter-denominational disputes of the time and by the rise of deism. For while deists generally accepted the proofs of creation, they were sceptical of the claims of revelation, particularly in so far as these were said to be testified to by miracles. Christian thinkers responded by assembling the 'evidences' and making the case for their credibility often in forms addressed to a general educated audience. So necessary was that task judged to be that it was sometimes sponsored by individuals and corporations.

One such benefaction was the gracious endowment provided out of the will of John Hulse (1708–1790), a student of St John's College Cambridge, from which he graduated in 1728, and an ordained clergyman of the Church of England. The terms of the continuing Hulsean provision include the requirement that each year a sermon be given before the University of Cambridge on the 'Truth and Excellence of Revealed Religion, or the Evidence of Christianity'.

Four years after Hulse's death in 1790, William Paley, of Christ's College, published a work entitled a *View of the Evidences of Christianity*, picking up and carrying forward a phrase that is common in eighteenth and nineteenth century Christian apologetics and which is echoed in the rubric of the Hulsean brief. More enduring than his defence of the credibility of the gospels, however, has been an aspect of Paley's foray into the field of philosophy of religion published in 1802 under the title *Natural Theology; or, Evidences of the Existence and Attributes of the Deity*.

Paley had a view about the relationship between these two works and their corresponding fields of revealed and natural religion, which was common through into the twentieth century. It is that captured in the expression associated with Thomistic, Roman Catholic thought, that philosophical speculation about the existence and nature of God belongs to the 'preambles to the faith' while reflection on Christian revelation yields the doctrine of the faith itself. Until his elevation to the Papacy, Cardinal Ratzinger was prefect of the 'Congregation for the Doctrine of the Faith', and one might wonder whether he might now consider founding a 'Congregation for the Preambles to the Faith'. Such would be no bad thing, given the right staffing.

G.K. Chesterton once observed that "when a man is asked to write down what he really thinks on education a certain gravity grips and stiffens his soul, which might be mistaken by the superficial for disgust".⁷ Certainly in present times there is no shortage of

⁷ G. K. Chesterton, *What's Wrong with the World* (London: Cassell, 1910) p. 194.

writers who, when asked to say what they really think about ‘revealed religion’ – not a term they would choose, of course – are gripped by authentic disgust and indignation, and strive to ensure that their readers do not mistake these for anything more benign.

Unsurprisingly perhaps, such critics of religious faith are typically no better disposed towards the philosophy of religion and reject arguments for the existence of God as either being fallacious or resting on false premises, or both. So, for example, Paley’s reasoning from the complexity to be found in nature, in the parts and bodies of animals, for example, to the existence of a designer of nature, analogous to reasoning from the intricacies of a watch to the existence of a watchmaker, is dismissed as erroneously presuming that complexity can only be the product of design. The aim of the criticism is not confined to pointing out the logical space for uncreated order, but extends to filling that space with a real alternative, the Darwinian theory of development through natural selection on the products of random mutation. The work of the blind, and purposeless watchmaker.⁸

Similarly, arguments from the existence of the world, conceived of as a series of contingent states or stages, to a cause of its existence, which were once standard fare within presentations of the ‘Evidences of the Existence of the Deity’, have been thought to be undermined by the idea that there is no contradiction in the notion of an infinite series of causes and effects, and hence no need to postulate a first cause at the foundation of cosmic history.

Such criticisms of the proofs of natural theology have not gone unchallenged. Some, for example, have argued that while complexity *per se* does not establish design, certain forms of complexity may be such that they could not be accounted for by any amount of cumulative natural selection. Alternatively it has been argued that while such levels of complexity could be so explained in principle, the actual history of life on earth is simply not long enough to have allowed for this. Likewise, some have argued that the impossibility of a series of self-sufficient causes is not to do with the impossibility of an infinite causal series but with the impossibility of the transmission of causality without there being an originator of efficacy outside the series. Positing a ‘first cause’ on this understanding is not a matter of assigning temporal priority, but of answering the requirement for a source or font of cause and effect as such.⁹

⁸ See Richard Dawkins, *The Blind Watchmaker* (New York: W.W. Norton, 1996).

⁹ See the case for and defence of theism in J. J. C. Smart and J. J. Haldane *Atheism and Theism* second edition (Oxford: Blackwell, 2002).

3. Understanding causality

Evidently the dialectical to and fro could continue, but rather than move backwards and forwards within this discussion I wish to broaden the idea of causality and of causal reasoning, which by stages will return us to the matter of grace. Paley, Hulse and others of the modern period of scientific philosophy that began in the seventeenth century and remains prominent still today thought of causality simply in efficient terms. That is to say, as a case of one thing or event bringing about another through the exercise of force, in effect the propagation of an impulse, pushing things into motion, or redirecting or arresting their motion. Certainly these sorts of phenomena do fall under the general idea of causality but they are not the only things that do so.

Imagine that as a preacher was expounding upon the 'evidences' of the Christian religion a small stone or a marble rolled out from under one of the pews, across the floor and came to a halt in the aisle in front of the pulpit. In wondering what caused this, one might first look to a prior event in which force was applied say by someone knocking it with his foot. But had the shape, or the material or the weight of the object been otherwise it might well have behaved quite differently. Even in taking account of such factors and of the ways in which they contributed to what happened one would not have a complete account until one knew whether the force that moved the ball was applied accidentally or on purpose. Which of these it was would have partly determined the nature of what happened. So in thinking about causality, and reasoning in terms of it, we have to go far beyond merely looking to efficient causes. We have to consider structures, material composition, weight, purpose, and no doubt other things besides. Furthermore, none of these factors is reducible to another, let alone are all of them reducible to one.

Suitably developed, reflection on the variety and distinctness of causal factors has the potential to reinvigorate traditional cosmological and design arguments to the existence of a first cause. Consider just the issue that formal or structural aspects are essential causes and cannot be reduced to efficient ones. This means that where structure appears as an effect it must be due to prior structure. So that while it may well be true that species have emerged, developed and changed through a process of natural selection this fact does not explain the source of the structures without which no such processes could occur. Without structure force is shapeless and directionless, but the formal structure and consequent intelligibility of nature are not self-explanatory. They call for explanation of a sort that simultaneously answers to their intrinsic character but also avoids further regress. Such an explanation is provided by the notion that the world expresses something of the formal structure of the mind of God.

Tracing religious effects

Whatever about the refurbishment of design arguments however, in present times the strongest felt challenge posed by evolutionary thinking is not the undermining of arguments to the existence of God, but its apparent subversion of the very status of religious thought and feeling as responses to reality, suggesting instead that they are evolutionary by-products of emergent behavioural strategies once beneficial to our ancestors. This application of evolutionary psychology is analogous to other styles of 'subversive disclosure' which take the form of explaining some area of thought and emotion as effects of non-rational forces. So, for example, Marx by reference to economic and class competition, and Freud, by reference to sexual impulse, both suggest that religious values are unwitting strategies for securing or suppressing certain interests.

Similar sociological and psychoanalytic causal reductions have been proposed for aesthetic experience, moral judgement, notions of political justice and personal purpose; and the deployment of evolutionary psychology is equally wide ranging. In response, however, the religious believer can take a lesson from replies to the earlier Marxist and Freudian reductions, which is simply to say that whatever the causal origins of a belief, and whatever advantage believing it may confer, there is still the question of whether it is true and reasonable. Mathematics, history, theology, philosophy, and even science, may in some sense be evolutionary by-products, but that in no way touches upon the rationality of these areas of study or the truth of their respective claims.¹⁰

In conclusion, therefore, I wish to bring the previous points together and to turn the tables against the reductionists by suggesting that religious thought and experience point to their having a religious cause. There are, I believe, three central components to natural religious feeling. First, a sense of human *contingency* and vulnerability: we find ourselves in our world not of our making, in which we might not have existed and in which our existence is fragile. Second, a sense of *conflictedness*: we recognise both responsiveness to the good, but also propensities to various kinds of evils, and we are aware of our inability to resolve these opposing tendencies. Third, we have a yearning for *completion* and transcendence: a longing to overcome our frailties and conflicts and to realise ourselves fully and fairly. Arising out of these are three 'spiritual' responses: *solidarity* in the face of contingency; *repentance* in the face of conflictedness; and personal *creativity* in response to the yearning for completion.

¹⁰ For further discussion of this important issue see John Haldane, 'Finding God in Nature: Beauty, Revulsion, and Contemporary Art' in Craig Titus (ed) *Christianity and the West* (Washington, DC: Catholic University of America Press, 2009).

These reactions and strategies have been responsible for some of the great and small moral works, social transformations, and artistic projects. But at the heart of the initial discoveries, and of the spiritual responses to them is the recognition that while we are oriented towards value we are also impotent to realise it broadly and enduringly. We find again and again the form of a possible human existence but also the impossibility of its being naturally realised. Both 'intuitions' call for explanation: being born to greater things – *ad majora natus sum* – but being unable to attain them. To identify the situation as an existential tragedy or absurdity is not to explain it. Yet there is an explanation which also offers the prospect of transformation. It is that which constitutes the essence of Paul's teaching: that our condition is one of 'fallenness' but that through grace we may be made anew and in Christ be drawn into blessedness. As for our religious feelings and the yearning for completion it points to that which is its effective, formal and final cause: in the words of St Augustine: 'You made us for yourself, Lord; and our heart is restless until it comes to rest in you'.
